GM calls this the net lash system and when all the parts are stock, this system works very well. With a stock camshaft, lifter, and pushrod, the system is designed to depress the piston inside the lifter by roughly 0.050-inch. The total piston travel in the lifter is roughly 0.120- to 0.150-inch which places the lifter roughly at mid-travel.

Tech Tip: Checking and Setting Lifter Preload on The LS Engine
Most quality lifter manufacturers publish this spec. Most short travel lifters are around .060 more or less while a GM LS7 lifter commonly used has .200 travel. If you can't find a spec on your lifter an easy way to find out is to place a dial indicator on the pushrod end of the rocker arm with cam lobe on its base circle.

But not all engines with hydraulic lifters have a preload adjustment. If the rocker arm is stud-mounted, such as on a Chevy, then proper procedure involves attaining zero lash plus the specified amount of preload. Some engine designs, such as the Pontiac V-8, use a stud, but are considered nonadjustable in factory form.

Setting valves cold with hot lash settings. By Jeff Smith. The mechanical cam is alive and thriving - thank you. While Crane offers an outstanding hydraulic roller lifter that we've done a story on, where we pushed a big-block Chevy happily to 7,500 rpm with juice lifters, this doesn't foreshadow the end of mechanical lifter.

Start the engine and check to ensure that you're getting adequate oil pressure and listen for lifter tapping. Add an oil-flushing solvent into your engine. Start the engine and set it to idle at about 1,000 rpm by turning the idle-adjustment screw on the throttle body clockwise. Allow the engine to idle for fifteen minutes.
